The Center for Biomedical Informatics (CBMI) was established in 2007 as a joint partnership between Washington University in St. Louis (WU) and BJC HealthCare to consolidate and organize the disparate informatics groups. The CBMI has a mandate to advance informatics across WU and BJC through four broad goals: 

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

The CBMI has four broad goals:

1. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.

2. Develop comprehensive training programs in biomedical informatics for scientists and health care professionals.

3. Promote the use of electronic resources to maximize the safety and quality of patient care at WU and BJC practice sites and to ensure that research resources are used to their fullest potential.

4. Develop and maintain the electronic infrastructure needed to facilitate clinical and translational research in a safe and ethical manner and to ensure that advances in medical science are translated into improvements in patient care as rapidly as possible.
